Bao-Oun,

You could always right the rejection with the presumption that they are the same poloxamer structure, or do a structure search at the library to confirm. Also, Ask applicant for the generic terminology of each since they are all tradenames. Hope this helps, Carlos

Carlos; Thank you for your helps. My claims read on a composition comprising an antigen, a polyxyalkylene block copolymer and an adjuvant that is not alum. The prior art I found uses the polymer is poloxamer 401, Pluronic L62LF, Pluronic L101, L121, L64, PRG1000, Terni 1501, 1301, and 130R. How I know these polymers have same structures with that of a polyxyalkylene block copolymer or not? Thanks.

Baoqun Li
